

3 **ABSTRACT OF THE DISCLOSURE**
4

5 A medical arm securing device for temporarily securing the arms of an
6 immobile person in an accessible position. The medical arm securing device includes
7 a main member, and a first slot and a second slot extending into the main member.
8 The slots receive the wrists of an immobile patient and prevent the arms from falling
9 to the sides. A securing slot extends into a bottom portion of the main member for
10 attaching to a strap. A plurality of notches preferably extend into the front and rear
11 ends of the main member for selectively receiving a band member.
